

Buurst Fuusion Overview

What Are Your Data Challenges?

Every day organizations create massive amounts of data that is often difficult to access, manage, and secure. With the expected rapid growth of data creation to be a staggering 50% at the edge, organizations will be challenged with how to manage their data growth. Organizations will need to overcome barriers such as, variability in location, network constraints, and disparate data formats to be able to scale and support future business success.

Fuusion is the most flexible edge solution allowing organizations the capability to securely control and centrally manage data flow from the edge to the cloud and the cloud to the edge. Built to help organizations connect data from various edge locations to cloud services regardless of data format or network conditions.

Data transfer and management between the edge and the cloud

- **Real-time Edge Data Processing** - Gather various data and process at the edge plus transfer to cloud services for analysis
- **Transfer Data over High Latency Networks** - Reliable data transfer between the edge and cloud over any network
- **Data Migration from a Manual to Digital Process** - Migrate data over any network instead of using manual USB or human interaction to gather and store data at another location
- **Smart Data Migration to the Cloud** - migrate unstructured edge data to a Data Lake storage in the cloud
